User Acceptance Testing (UAT) - Software Testing

Last Updated : 23 Jul, 2025

User Acceptance Testing (UAT) is a **important phase in software testing** where the software is **tested in a real-world scenario by end-users** to ensure it meets their requirements and functions as expected. Unlike other forms of testing, UAT focuses on validating the software's **user-friendliness, functionality, and performance from the user's perspective**.

What is user acceptance testing (UAT)?

User Acceptance Testing (UAT) serves the purpose of ensuring that **the software meets the business requirements** and is **ready for deployment by validating its functionality in a real-world environment**. It allows **end-users** to test the **software** to ensure it meets their needs and operates as expected, **helping to identify and fix any issues before the final release**. UAT is **crucial for quality assurance** and **customer satisfaction**, as it ensures that the software is **user-friendly, reliable, and meets all specified criteria**.

Acceptance criteria attributes for UAT

- Completeness
- Accuracy
- User-friendliness
- Performance
- Reliability
- Security
- Scalability
- Compatibility

What is the purpose of UAT?

The **purpose** of User Acceptance Testing (UAT) is to **identify bugs in software, systems, and networks that may cause problems for users**. UAT ensures that software can **handle real-world tasks** and perform to development specifications. Users are allowed to interact with the software before its official release to see if any features were overlooked or if any bugs exist.

Basic guidelines of UAT: When doing UAT, it is **important to test with users in different locations, not just on different devices**. It is better to have one person in a separate location rather than testing with people who are already online together. Also, using email is often more reliable than social media, especially for private communication, like delivering services through apps like Signal.

Who performs UAT?

User Acceptance Testing (UAT) is typically **performed by end-users or clients who will ultimately use the software in their daily operations**. These individuals represent the target audience for the software and are responsible for validating whether the **software meets their requirements and expectations before it is deployed**.
